Abstract

Introduction: Drug abuse is becoming the emerging problem in the youth which breaks back of any nation and it is more prevalent in tourist areas.

Material and Methods: A cross-sectional survey was conducted during the month of January 2015 at health camps organized in a tourist area by an NGO HR foundation. Total 200 subjects were studied.

Results and conclusion: In this study majority of cases were males belonging to younger age groups. Majority of the patients belonged to lower socioeconomic section. 60% of the subjects were poly substance abuser. Charas was the most commonly abused substance followed by alcohol.

Keywords: Substance Abuse; Youth; Drugs; Tourist

Introduction

The drug abuse is the complex problem of not only of individual but also of the entire community [1]. According to the World Health Organization (WHO) substance use is persistent or sporadic drug inconsistent with or unrelated to acceptable medical practices [2]. A drug is broadly defined as any chemical agent that affects living protoplasm. Some drugs reinforcement i.e. they produce the effects that user enjoys and which make him/her wish to take it again or to induce drug seeking behavior [3]. Drug addiction symptoms or behaviors (in general) includes: Feeling that you have to use the drug regularly; Failing in your attempts to stop using the drug; Spending money on the drug, even though you can’t afford it; Doing things to obtain the drug that you normally wouldn’t do, such as stealing; Feeling that you need the drug to deal with your problems; and Focusing more and more time and energy on getting and using the drug. The drug addiction is rampant in tourist areas. The aim of this study was to find out profile and pattern of substance abuse in a tourist area of Srinagar.

Material and Methods

A cross sectional survey was conducted during the period of January 2015 at a tourist area in Srinagar. The relevant data was collected related to profile and pattern was collected using a predesigned and pretested proforma (Figures 1 & 2). Data was entered in MS Excel and analyzed by using percentage and proportion wherever appropriate.

Results

The information was gathered for a total of 2000 participants in the study out of which 200 turned out to be substance abusers (Figure 3).
Discussion

The drug abuse is the complex problem of not only of individual but also of the entire community. According to the World Health Organization (WHO) substance use is persistent or sporadic drug inconsistent with or unrelated to acceptable medical practices. It the biggest challenge that youth has to face all over the world. In the present study, the maximum numbers of subjects were found to be age less than 40 years (Figures 4 & 5). The various studies [1,5,6]
conducted also show that maximum number of study subjects were adults aged less than 40 years. The trend is disturbing as the most productive section of society is involved in drug abuse which can have disastrous consequences. 85% of the subjects were males similar findings were observed in other studies[1,4,5,6] 60% of the cases belonged to lower economic class. Charas was the most commonly abused substance may be because of its easy availability followed by alcohol.

**Conclusion**

The socio-demographic profile revealed that younger age, low socio economic status and educational background were frequent observations with drug abusers.
